RI J. Mol. Appl. Genet. 2:579-588(1984).

CC -1 CAPALYTIC ACTIVITY: Endobydrolysis of 1,4-alpha-glucosidic CC -1 CAPALYTIC ACTIVITY: Endobydrolysis of 1,4-alpha-glucosidic CC -1 CAPALYTIC ACTIVITY: Endobydrolysis of 1,4-alpha-glucosidic CC -1 CAPALYTIC ACTIVITY: CC -1 Linkages in oligosaccharides and polysaccharides ACTIVITY.

CC -1 COPACTOR: BINDS A CALCIUM ION REQUIRED FOR ITS ACTIVITY.

CC -1 DEVELOPMENTAL STAGE: PRODUCTION OF ALPHA-AMYLASE IS HORMONALLY REGULATED. GERMINATING EMBRYOS PRODUCE ALPHA-AMYLASE. THE ENZYME THEN LOUGHER HITHIN 10 HOURS SITMULATES THE ALPHA-AMYLASE. THE ENZYME THEN DEGRADES THE STARCH WITHIN THE ENDOSPERM FOR USE BY THE CC DEVELOPING PLANT EMBRYO.

CC -1 MISCELLANEOUS: THERE ARE AT LEAST 4 TYPES OF ALPHA-AMYLASE IN BARLEY.

CC -1 MISCELLIANEOUS: TYPE B ISOZYME MRNA IS UNDETECTABLE IN UNSTIMULATED CC GELLS AND INCREASES A HUNDRED-FOLD AFTER STIMULATION WITH CELLS AND INCREASES A HUNDRED-FOLD AFTER STIMULATION WITH CC GIBBERELLIC ACID.

CC SIMILARITY: BELONGS TO FAMILY 13 OF GLYCOSYL HYDROLASES, ALSO KNOWN AS THE ALPHA-AMYLASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Вb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

COPACTOR: BINDS A CALCIUM ION REQUIRED FOR ITS ACTIVITY.
SUBCELLUIAR LOCATION: EXTRACEILULAR.
DEVELOPMENTAL STAGE: PRODUCTION OF ALPHA-AMYLASE IS HORMONALLY
REGULATED. GERMINATING EMBRYOS PRODUCE THE HORMONE GIBBERELLIC
ACID, WHICH WITHIN 10 HOURS STIMULATES THE ALEURONE CELLS COVERING
THE ENDOSPERM OF THE SEED TO PRODUCE ALPHA-AMYLASE. THE ENZUME
THEN DEGRADES THE STARCH WITHIN THE ENDOSPERM FOR USE BY THE
DEVELOPING PLANT EMBRYO.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DOMAIN: Consists of two putative central coiled-coil regions flanked by putative globular regions at the N- and C-termini. SIMILARITY: Belongs to the SMC family. SMC4 subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    unidentified proteins.
SUBCELLULAR LOCATION: Nuclear. Associates with chromatin after 30-cell stage. It specifically localizes to the X chromosomes of wild-type XX embryos, but remains diffusely distributed throughout wild-type XX embryos, backware how 7K is required for its X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 may reduce the X-chromosome transcript level chromatin structure during interphase cells. Goldman S., Mawal Y., Wu R.;

Submitted (FEB-1992) to the EMBL/GenBank/DDBJ databases.

-1- FUNCTION: IMPORTANT FOR BREAKDOWN OF ENDOSPERN STARCH DURING GERMINATION.

-1- CATALTIC ACTIVITY: Endohydrolysis of 1.4-alpha-glucosidic linkages in oligosaccharides and polysaccharides.

-1- COFACTOR: BINDS A CALCIUM ION REQUIRED FOR ITS ACTIVITY.

-1- SUBBURT: MODOMBEY.

-1- DEVELOPMENTAL STAGE: EXPRESSED AT A HIGH LEVEL DURING GERMINATION IN THE ALEURONES CELLS UNDER THE CONTROL OF THE PLANT HORMONE GIBBERELLIC ACID AND IN THE DEVELOPING GRAINS AT A LOW LEVEL.

FUNCTION: NUCLEAR INCLUSION PROTEIN A HAS PROTEOLYTIC ACTIVITY.

CAPALYTIC ACTIVITY: Hydrolyzes glutaminyl bonds, and activity is further restricted by preferences for the amino acids in P6 - P1' that vary with the species of potyvirus, e.g. Glu-Xaa-Xaa-Tyr-Xaa-Gln+(Ser or Gly) for the enzyme from tobacco etch virus. The natural substrate is the viral polyprotein, but other proteins and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            uire a functional propionyl-CoA carboxylase.";

Microbiol. 19:977-984 (1996).

CATALYTIC ACTIVITY: ATP+ propanoyl-CoA + HCO(3)(-) = ADP + Phosphate + (5)-methylmalonyl-CoA.

PATHWAY: KEY ENZYME IN THE CATABOLIC PATHWAY OF ODD-CHAIN PATHWAY: ISOLEUCINE, THREONINE, METHIONINE, AND VALINE.

SUBUNIT: PROBABLY A DODECAMER COMPOSED OF SIX BIOTIN-CONTAINING ALPHA SUBUNITS & SIX BETA SUBUNITS (BY SIMILARITY).

SIMILARITY: BELONGS TO THE ACCD / PCCB FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          European Bioinformatics Institute.

1- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + trna = S-adenosyl-L-homocysteine + trna containing N(1)-methylguanine.

1- SUBCELLULAR LOCATION: Cytoplasmic (Potential).

1- SIMILARITY: BELONGS TO THE RNA METHYLTRANSFERASE TRMD FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDIINE-21145866; PubMed-11248100;

(ATRIVIC ACTIVITY: S-adenosyl-L-methionine + trna - S-adenosyl-L-homocysteine + trna containing N(1)-methylguanine.

SUBCELIULAR LOCATION: Cytoplasmic (Potential).

SIMILARITY: BELONGS TO THE RNA METHYLTRANSFERASE TRMD FAMILY.
